

Product advantage begins **before** the mission window opens.

Two Six is bringing agentic orchestration, information operations, and CBRNE sensing into a fast-expanding product portfolio. The product leader's job is not merely to maintain roadmaps. It is to synchronize mission pull, operator authority, integration readiness, and acquisition reality early enough for teams to act.

My thesis: manage the portfolio around a shared Mission Window Contract - not a forced common interface - so each product can move faster without weakening trust, field fit, or product-team autonomy.

Mission Window Synchronizer

ILLUSTRATIVE - PUBLIC-SOURCE GROUNDED

A qualitative portfolio decision model

Aligned

Guardrail proof

Aligned

Needs proof

ACCELERATE

Use bounded mission pilots to prove human-authority guardrails, time-to-decision, traceability, deployment effort, and acquisition fit while preserving legacy-system continuity.

Guardrailed mission pilots

This model does not claim knowledge of Two Six's internal portfolio state. It demonstrates how I would make investment, integration, proof, and sequencing decisions more explicit.

Reset to Helix

WHY THIS ROLE MATTERS NOW

Two Six has crossed from proving products to shaping a portfolio category.

The public signals point to a company compressing R&D, product transition, deployment, and growth into one operating system. That creates leverage - and a genuine coordination burden for product leadership.

2024

Two Six reported 25% organic revenue growth, more than \$1.5 billion in single-award contract ceiling, \$60 million in annual recurring revenue, and support for more than 46,000 mission operations.¹

2025-2026

The company expanded its product portfolio, infrastructure, and leadership bench, including a Chief Product Officer, VP of Product Management, SVP of Product Engineering, and VP of Product Sales.²

May-June 2026	Helix launched as a legacy-to-agentic orchestrator; Sentr followed as an information-operations command center powered by Helix; SIGMA was deployed for multi-agency CBRNE security operations at the FIFA World Cup. ³⁻⁵
The implication	Decision Advantage is becoming a portfolio business, not a collection of unrelated programs. Roadmaps, product tradecraft, product support, acquisition pathways, and reusable platform leverage now have to reinforce one another.

THE REAL MANDATE

Move at commercial AI speed inside mission systems that cannot tolerate untrusted action or careless change.

The role must make four contradictions productive rather than pretending they disappear.

01	Frontier technology vs. mission assurance	Agentic AI must create decisive speed while keeping source traceability, evaluation, and human authority explicit.
02	Portfolio leverage vs. product specificity	Helix, Sentr, and SIGMA can share platform economics and tradecraft without flattening distinct operator workflows or mission consequences.
03	Empowered teams vs. portfolio direction	PMs and designers need autonomy close to users; executives need clear investment choices, sequencing logic, and competitive positioning.

CANDIDATE THESIS

Use one decision contract across the portfolio, then let each product earn its own roadmap.

The Mission Window Contract

A compact record for every meaningful product investment: the mission outcome, operator decision, human authority, integration constraint, evidence standard, acquisition path, and field-learning return.

It is deliberately not a common UI, generic maturity score, or centralized backlog. It is a shared way to decide.

01	Frame the mission outcome What enduring operator problem changes, for whom, and under what consequence?	PRIORITIZE
02	Clarify authority and workflow What can AI recommend or execute, what must a human retain, and what environment limits access?	BOUND
03	Expose integration and support burden What legacy systems, data rights, deployment patterns, training, and sustainment work sit behind the product promise?	INTEGRATE

04	Set the evidence threshold Which mission, adoption, trust, reliability, and economic signals justify acceleration or scale?	PROVE
05	Return learning to the portfolio Which field and support signals should change roadmaps, platform investments, positioning, or a stop decision?	LEARN

VERIFIED EVIDENCE TRANSFER

A builder's background across AI workflows, high-reliability systems, field operations, and support-heavy products.

Compunetics	 High-consequence product and program leadership Led engineering, manufacturing, quality, customer delivery, and complex technical programs in advanced electronics; collaborated with DoD and other high-consequence customers; built process controls and root-cause mechanisms.
Vape-Jet	 Product-support signals turned into operating decisions Connects factory, field, customer, and machine-fleet signals across roughly 1,000 fielded robots into prioritized work, earlier risk detection, dashboards, standard work, training, and accountability.
DudeWorth	 Agentic AI with human judgment and governance Designs AI-readiness frameworks and agentic workflow patterns using structured context, retrieval, human review, escalation, decision records, evaluation, and governance rails.

Amazon + ZeusVu

Customer-backward launches and regulated field execution

Built operating mechanisms in a 24/7 launch environment and led regulated autonomous-systems operations with a 100% safety record and no FAA incidents.

BALANCED SCORECARD

Measure whether the portfolio changes decisions and missions - not whether it produces more roadmap.

Mission outcome Time-to-decision, action quality, mission completion evidence	Product behavior Discovery-to-decision latency, backlog clarity, roadmap confidence	Trust and risk Traceability, human checkpoints, evaluation coverage, reliability
Adoption and support Time-to-first-value, training burden, recurring support drivers	Economics and acquisition Deployment effort, reuse, support intensity, vehicle fit	Learning speed Field evidence captured and portfolio decisions changed

No unsupported targets are assumed here. The first step is to agree on definitions and baselines with product, growth, engineering, program, and mission leaders.

Read the mission, strengthen the product system, and prove the cadence with real portfolio decisions.

Days 1-30

Read the portfolio

- Mission and stakeholder listening
- Roadmap, backlog, support, and acquisition evidence review
- User-access and classified-work constraints
- PM and UX coaching baseline

Days 31-60

Install the contract

- Shared outcome and evidence language
- Portfolio decision rights
- Three priority Mission Window hypotheses
- AI-assisted product tradecraft pilots

Days 61-90

Run the reviews

- Helix, Sentr, and SIGMA review scenarios
- Roadmap, GTM, support, and engineering alignment
- PM and designer coaching in live work
- Evidence-based invest, integrate, prove, or hold decisions

Days 91-120

Institutionalize learning

- Quarterly portfolio review
- Field and support learning return
- Shared scorecard and operating cadence
- Executive roadmap narrative and next bets

WHY THIS BACKGROUND TRANSFERS

Product leadership built in the work, not performed from a distance.

The verified record does not depend on a prior Group Product Manager title. It shows direct work across backlogs, operating systems, technical programs, customer support, field constraints, AI-enabled workflows, coaching, and cross-functional decision mechanisms.

The strongest day-one contribution is a product leader who can move between strategy and the actual work - and who knows that trust is earned through evidence, not AI vocabulary.

Working posture

Builder: maintain a backlog, prototype decision artifacts, use AI to accelerate discovery and engineering tradecraft, and fill gaps when needed.

Coach: strengthen PM and UX judgment through live work, clear decisions, and reusable review mechanisms.

Strategist: isolate the problem that creates customer and competitive advantage, then make investments explicit.

Mission partner: respect the constraints and expertise of operators, program teams, acquisition leaders, and cleared practitioners.

EXECUTIVE INTERVIEW QUESTIONS

Questions designed to discover the operating truth behind the title.

-
- | | |
|-------|--|
| 01 | Where does Decision Advantage currently lose the most time: customer discovery, product transition, integration, acquisition, deployment, or field learning? |
| <hr/> | |
| 02 | Which decisions belong at portfolio level, and which should remain with empowered product teams? |

03	How do you distinguish reusable Helix leverage from the mission-specific differentiation that Sentr, SIGMA, and incumbent products must preserve?
04	What evidence must a roadmap investment show before it receives scarce product, engineering, or growth capacity?
05	Where are PMs and UX designers most constrained by access to users, data, classified environments, or acquisition timing?
06	Which support patterns recur often enough to become product capability rather than program-specific labor?
07	What would make you say after 120 days that the product operating model is materially stronger?
